

IN THE ABSTRACT:

Please replace the abstract with the following abstract:

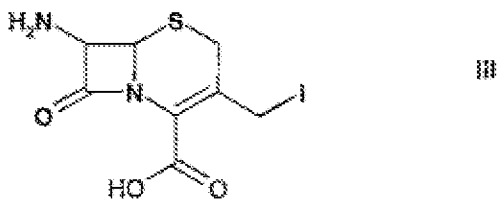

A process for the production of intermediates having a formula IA

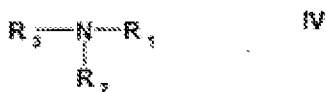

that can be used for the synthesis of cephalosporins, such as cefepime of formula V.
The intermediates of formula IA are produced by desilylation of a compound of formula II

wherein R4 is a silyl-protecting group, with a protic solvent to obtain a compound of formula III,

and reacting the compound of formula III with an organic base of formula IV

wherein R2 and R3 together represent a C4-alkylene group, and with the adjacent nitrogen atom form a saturated 5-membered heterocycle, and R1 represents a methyl group, to obtain the compound of formula 1A.
